SCHALUNGS ZUBEHÖR SHUTTERING ACCESSORIES

PU glue

Cut a small piece from the tip of the bottle, so that there is only a small opening. Apply glue sparingly near the inner walls and centre of cutting. Put in the rondoplex repairing spot with hand and fix lightly with a hammer.

If you use too much PU glue, the repairing spot can be partially pressed out of the hole, due to foaming of the glue.

PU glue reacts in connection with oxygen.

The bottle has to be closed after having used the glue. After having finished the repair it is necessary to turn the bottle upside down, so that the remaining air can escape upwards. This way the tip of the bottle rests free from hardened PU glue.

Before starting with your repair work on shuttering it is recommended to make several tests.
